

**Brushing your pet's teeth is a fantastic way
to slow the progression of periodontal disease!**

Periodontal disease can cause painful teeth and gums, bad breath from bacteria, difficulty chewing, behavior changes from discomfort (less active, less tolerant), and even life threatening heart, liver and kidney disease.

CAUTION: If you suspect your pet is experiencing pain from their teeth or gums, please call our office immediately!

Brushing may increase your pet's pain level if periodontal disease has set in. Our doctors will know how to help make your pet comfortable.

Tips for brushing success: Visit our website LaCrosseVet.com and look for the video under Services/Dentistry

Check off the days as you brush!
